May also be part of the signaling network controlling cellular adhesion. In vitro, is able to phosphorylate CDC25C and casein.

CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

SUBGUNIT: Binds to the calcium/integrin-binding protein (CIB). This interaction probably occurs via the POLO-box domain.

SUBCELIULAR LOCATION: Membrane-associated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TISSUE SPECIFICITY: Transcripts are highly detected in placent lung, followed by skeletal muscle, heart, pancreas, ovaries an kidney and weakly detected in liver and brain. May have a shor half-live. In cells of hematopoietic origin, strongly and exclusively detected in terminally differentiated macrophages. Transcript expression appears to be down-regulated in primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GO:0006468; P:protein amino acid

SIMILARITY: Contains 2 POLO box domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FUNCTION: Serine/threonine protein kinase involved in regulations that the cell cycle. May also be part of the signaling network controlling cellular adhesion. In vitro, is to phosphorylate CDC25C and casein (By similarity).

CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

SUBUNIT: Binds to the calcium/integrin-binding protein (CIB).

interaction probably occurs via the POLO-box domain (By

SIMILARITY: Belongs to the Ser/Thr family of p CDCS/Polo subfamily.
                                                                                                                                                                                                                                                                                                                  FUNCTION: Serine/threemine protein kinase involved in regulating M phase functions during the cell cycle. May also be part of the signaling network controlling cellular adhesion. In vitro, is able to phosphorylate CDC25c and casein (By similarity). CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein. SUBUNIT: Binds to the calcium/integrin-binding protein (CIB). This interaction probably occurs via the POLO-box domain. SUBCELLULAR LOCATION: WHEN INDUCED, IT TRANSLOCATES INTO THE DENORITES OF ACTIVATED NEURONS.
                                                                                                                                                                            CDC5/Polo subfamily.
SIMILARITY: Contains 2 POLO box domains.
                                                                                                                                                                                                                                                                                                          TISSUE SPECIFICITY:

SIMILARITY: Belongs to the Ser/Thr family of protein kinases. NIM1
                                                                                                                                        261

Novel human protein phosphatase and kinase proteins for diagnosis, treatment and prevention of gastrointestinal, immune system, neuro and cell proliferative disorders. neurological

Claim 5; Page 98; 103pp; English.

The present sequence is that of cDNA encoding novel human protein

```
CC phosphatase and kinase protein PPHKP-5 (see AAB20326). The cDNA was initially identified in Incyte Clone ID No. 1271505CBI, from a foetal CC lung tissue library. The PPHKP-5 gene was localised to human chromosome CC 20. Tissues that express PPHKP-5 (as a fraction of total tissues CC expressing PPHKP-5) include reproductive (0.288), gastrointestinal CC (0.212) and haematopoletic or immune (0.192). Diseases or conditions CC associated with tissues expressing PPHKP-5 (as a fraction of total CC tissues expressing PPHKP-5) include cancer (0.577), inflammation or CC trauma (0.327) and cell proliferation (0.308). The encoded protein shows tomology to rat kinase. The invention provides human PPHKP-1 to -11 CC polypeptides (see AAB20322-32) and polynucleotides (see AAF30476-86). It CC antagonists, as well as methods for diagnosing, treating or preventing CC disorders associated with expression of PPHKP, including gastrointestinal CC disorders, immune system disorders, neurological disorders and cell proliferation cancer
                                                                                                                                                                                                                                                                                                                                                                                                      ДЪ
